Primary Tumors of the Canine Conjunctiva, Eyelids and Orbit

Typical patients with NHL orbital tumors are past middle age, have equal sex predilection, and present with diplopia, epiphora, and painless proptosis or displacement of globe position. Clinical signs, demonstrated in Figures 2a and 2b, include eyelid swelling, mechanical ptosis, variable amounts of proptosis, and a conjunctival salmon-patch.

Update on Orbital Tumors: Individual Orbital Tumors

Intraocular and orbital tumors may also extend into the conjunctiva. Most important is the sebaceous gland carcinoma of the eyelid which can exhibit pagetoid invasion and direct invasion into the conjunctival epithelium.[1 , 2] Uveal melanoma can extend extrasclerally into the subconjunctival tissues.

Tumors of the ocular surface: A review

The benign epidermal tumors of the eyelid are similar to those observed in the other sun-exposed areas of the skin, but they may also include conjunctival tumors as well. Some of these tumors represent manifestations of systemic disease (Chap. 12). A classification of the epidermal eyelid tumors is presented in Table 3.1.

Eyelid

Conjunctival tumors are cancers that grow on the outside of the eye. They include squamous cell, malignant melanoma, and lymphoma. Squamous cell is the most common type of conjunctival tumor. It rarely spreads, but may grow into the eye socket and sinuses. Malignant melanomas may start as a freckle or grow from a colored area.
